
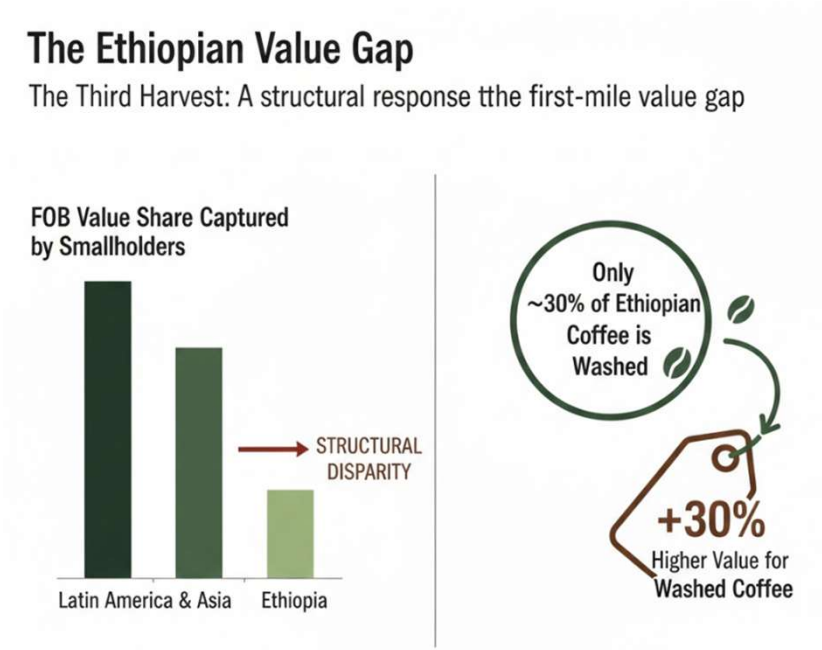
THE THIRD HARVEST

Powered by TriveraPro™

Engineering Regenerative Coffee Infrastructure at Origin

The Current Reality

- Ethiopia produces some of the world's most celebrated coffees. Yet its smallholders capture among the lowest shares of FOB value globally when compared to Latin America and Asia.
- Only ~30% of Ethiopian coffee is washed.
  Washed coffee typically generates ~30% higher value.
- The opportunity for value addition at the first mile remains structurally underdeveloped.



Why the Value Gap Persists

Smallholders do not lack capability.
They lack infrastructure.

Constraints include:

- No access to finance
- No ownership of washing equipment
- No rural electricity access
- Advance payments from middlemen that weaken bargaining power
- Historic concentration of washing infrastructure in commercial aggregators

The result: Farmers sell early, at subsistence levels, without participating in value creation.

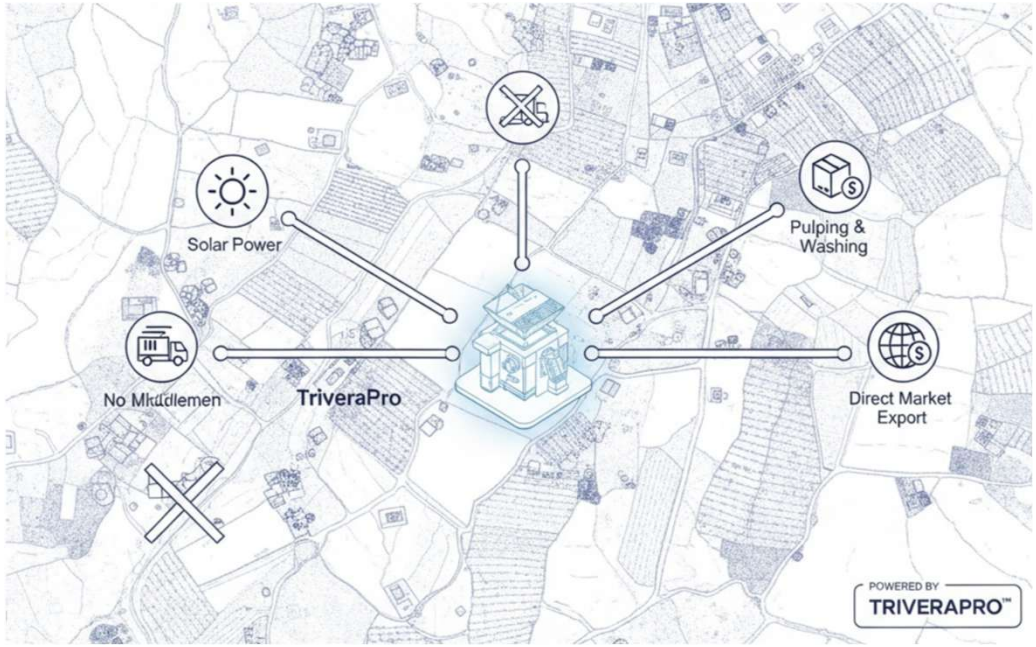
The SPX Response

SPX operates at the intersection of:

- Coffee
- Infrastructure
- Energy
- Regenerative systems

We are not an NGO. We are system builders.

- SPX is an Africa based systems architect.
- We design, integrate, and deploy infrastructure solutions that rebalances value capture at the first mile.
- Our response is not symbolic.
  It is structural.



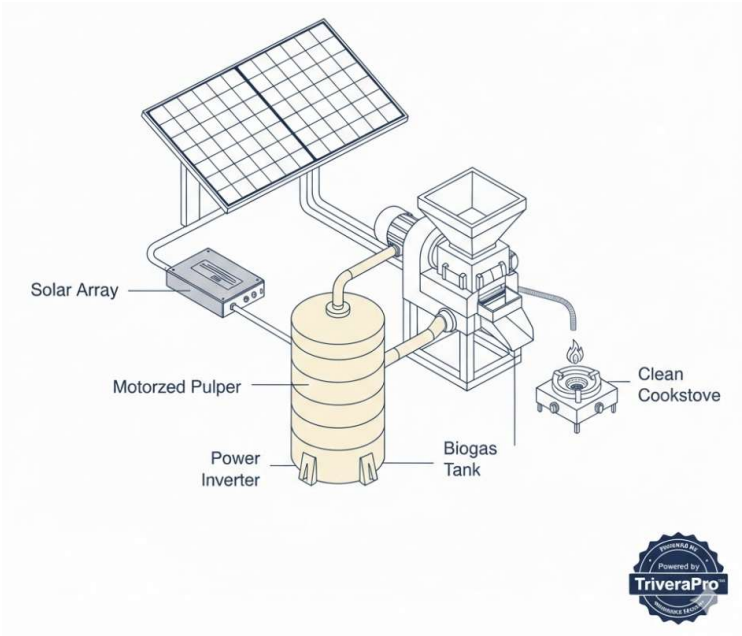
TriveraPro™

Patent-Pending Integrated Platform

TriveraPro™ is SPX's integrated and system-engineered platform.

It combines:

- Solar-powered pulping
- Inverter-driven processing
- Waste grinding technology
- Biogas conversion tanks
- Clean cooking gas systems
- Compost regeneration outputs
- Solar and inverter components are integrated within the broader TriveraPro™ system architecture.
- Patent pending under the TriveraPro™ brand (Ethiopian IP office)

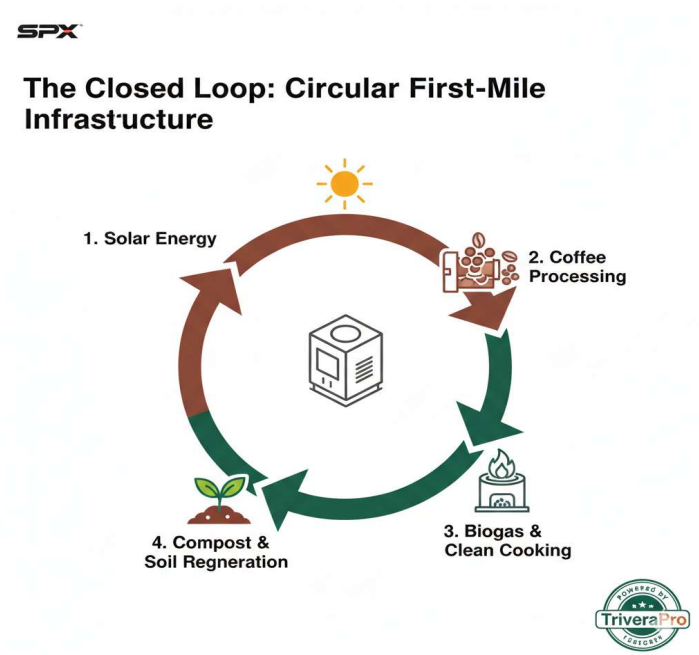


This is not standalone equipment. It is a closed-loop infrastructure platform.

The Closed Loop System

Sun → Pulping → Waste Processing → Biogas → Clean Cooking → Compost → Soil Regeneration

Outputs:
Value addition (~30% uplift via parchment)
Clean household energy (reduces wood use and respiratory risk)
High-nutrient compost returned to soil



One crop. Multiple value streams.

The Third Harvest

The Coffee tree delivers one harvest: The fruit.

TriveraPro™ enables:

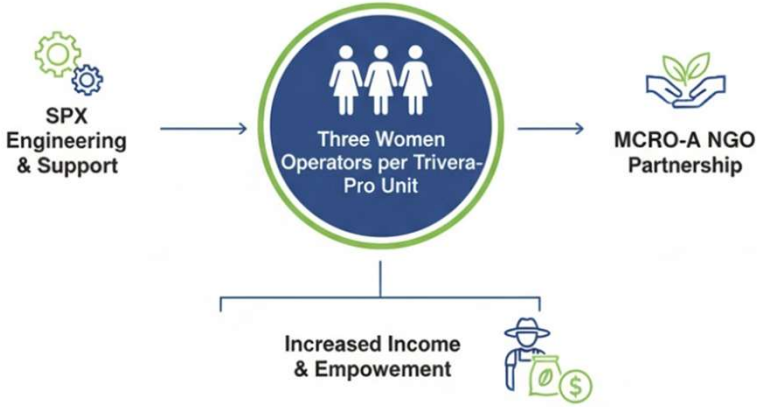
- A Second Harvest. Value addition at the first mile.
- And a Third Harvest. Energy security, health dividend, and soil regeneration.

The Third Harvest is the programmatic deployment of this infrastructure.

Women-Led Enterprise Model

Each unit supports a team of 3 women in a single household, they:

- Wash and pulp coffee locally
- Capture higher value
- Access productive energy year-round
- Produce regenerative compost



Implementation is conducted in partnership with MCRO, a women-focused Ethiopian NGO that supports mobilization and community structuring.

SPX leads:

- Engineering
- Procurement integration
- Installation
- Technical training
- Maintenance training
- Monitoring & evaluation
- This is locally designed, locally implemented infrastructure.

Minimum Viable Scale

For the system to function efficiently:

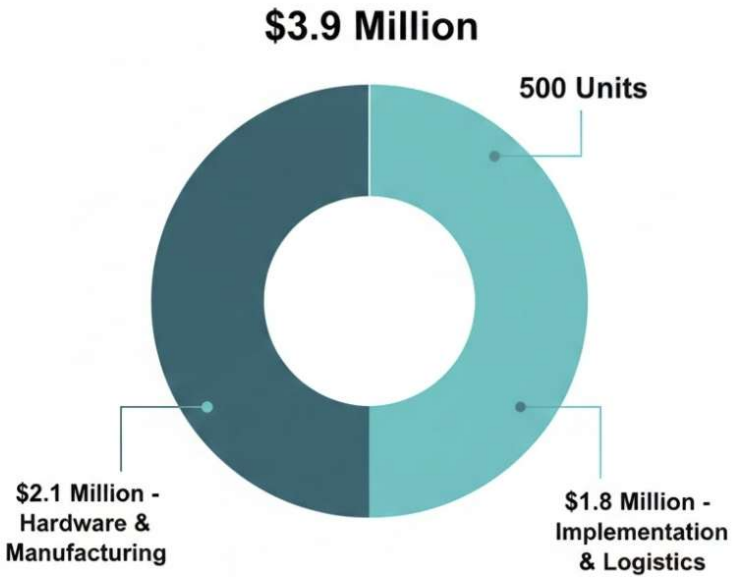
Minimum deployment: 500 units.

Why scale matters:

- Manufacturing efficiency
- Distribution logistics
- Training network viability
- Maintenance system sustainability
- Impact measurability

Total capital requirement:
$3.9 million USD

$2.1M – TriveraPro™ hardware
$1.8M – Implementation, training, MEL, logistics



Seasonal Deployment Window

- Coffee washing season begins in September.
- Manufacturing, transportating, distribution, and installation require immediate capital mobilization.
- Funding must be secured within weeks to meet the coming season. (ie no later than end of March, 2026)
- This is a time-sensitive infrastructure deployment.

Proud Coffee Women™

Proud Coffee Women™ is the identity label associated with The Third Harvest deployment clusters.

It represents:

- Women-led value addition
- Renewable-powered processing
- Circular waste-to-energy systems
- Regenerative soil practices

The label is extended to participating entities aligned with The Third Harvest program.

Proud Coffee Women™ coffees are sourced through participating export partners within the SPX ecosystem.

Participation is designed to operate alongside committed sourcing relationships.

From Buyer to Partner

The future of responsible sourcing is participatory, not symbolic.

The Third Harvest invites coffee companies to:

- Align infrastructure investment with origin sourcing
- Embed regenerative systems within their supply footprint
- Participate in measurable first-mile transformation

The most meaningful participation occurs where infrastructure scale and sourcing relationships advance together.

Why This Matters for DFIs

The Third Harvest delivers:

- First-mile income uplift
- Women-led enterprise ownership
- Renewable energy deployment
- Methane reduction and deforestation mitigation
- Circular nutrient regeneration
- Replicable infrastructure model

This is systems-level intervention, not isolated aid. It is scalable, measurable, and origin-designed.

SPX

Through TriveraPro™, The Third Harvest, and Proud Coffee Women™ and the partnership with MCRO (A women’s focused NGO), we are engineering structural transformation in Ethiopia’s coffee economy.

Closing

- Coffee has long delivered one harvest.
- The Third Harvest builds the second and the third.
- We invite fair-minded partners to participate —
  not only in purchasing Ethiopian coffee,
  but in strengthening the ecosystem that sustains it.
